FOOD SAFETY INNOVATION

NEW DESIGN of reusable egg trays

The replacement of the original packaging of the suppliers avoids the introduction into the chamber of new contaminations. In the case of eggs, this practice is especially important since traditionally eggs have been a source of transmission of Salmonella (both the egg itself and the cartons), so the change of packaging is appropriate.

*Porous materials such as **wood or cardboard** are not authorized by the regulations in cold rooms, because they are totally unhygienic methods they must be replaced by other materials such as plastic.*

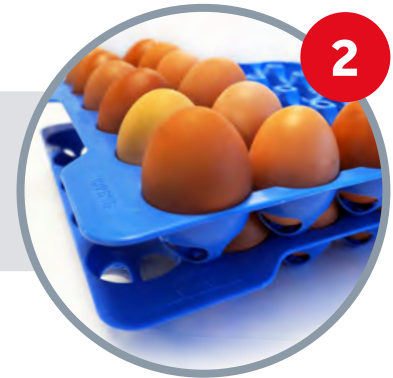

Perforated base

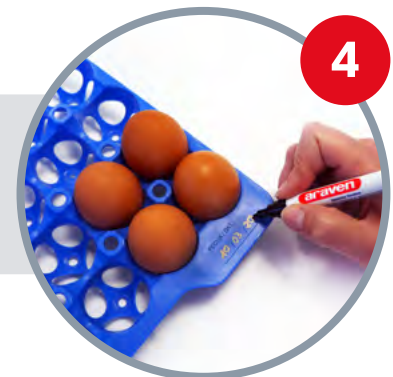

Allows air to circulate around the eggs, preventing mould from forming. Allows you to spot broken eggs.

The trays can be piled when empty, allowing you to optimise storage space. The trays can be stacked thanks to the 14 supports on the underside of the tray which correspond to points on the top of the bottom tray.

Side grippers making it easier to transport.

Space for indicating best before date. Transfer the best before date that appears on the egg or packaging.
